

**Marking Scheme
Sample Question Paper
Chemistry XI
2024-25**

| Q. No | Sub part | Value Points | Step wise marks | Total Marks |
|-------|----------|---|-----------------|-------------|
| 1 | | (C) 2 | 1 | 1 |
| 2 | | (C) The wavelength of the incident radiation required for ejection of electrons is the same for all the metals. | 1 | 1 |
| 3 | | (D) 496, 737, 577 , 786 | 1 | 1 |
| 4 | | (D) $\text{NH}_3 > \text{NF}_3 > \text{BF}_3$ | 1 | 1 |
| 5 | | (D) ΔH is positive and ΔS is negative | 1 | 1 |
| 6 | | (B) I^- |)1 | 1 |
| 7 | | (B) $[\text{Sn}^{4+}] [\text{S}^{2-}]^2$ | 1 | 1 |
| 8 | | (D) P_4 | 1 | 1 |
| 9 | | (B) 2- Methylpropene | 1 | 1 |
| 10 | | (D) -315 kJ | 1 | 1 |
| 11 | | (C) 3 | 1 | 1 |
| 12 | | (B) Steam Distillation | 1 | 1 |

| | | | |
|----|---|------------|---|
| 13 | (B) Both A and R are true but R is not the correct explanation of A | 1 | 1 |
| 14 | (A) Both A and R are true and R is the correct explanation of A | 1 | 1 |
| 15 | (A) Both A and R are true and R is the correct explanation of A | 1 | 1 |
| 16 | (D) A is false but R is true | 1 | 1 |
| 17 | $\lambda = \frac{h}{mv} = \frac{6.626 \times 10^{-34} \text{ Js}}{9.1 \times 10^{-31} \text{ Kg} \times 2.19 \times 10^6 \text{ ms}^{-1}}$ $= 0.332 \times 10^{-9} \text{ m} = 0.332 \text{ nm}$ | 1 1 | 2 |
| 18 | <p>(a) S has more negative first electron gain enthalpy. The size of O is much smaller than that of sulphur. As a result, electron electron repulsions in the smaller 2p subshell of oxygen are comparatively larger than those present in the bigger 3p-subshell of sulphur. Therefore, S has a higher tendency to accept an additional electron than oxygen.</p> <p>(b) C has more negative electron gain enthalpy than Si. This is because C-atom has smaller size than Si atom and electron - electron repulsions in carbon and silicon unlike oxygen and sulphur are not very large because they contain only four electrons in the outermost shell.</p> | 1 1 | 2 |
| 19 | <p>(a) Molecular orbital electronic configuration of $\text{Be}_2 = \sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2$ Bond order $= \frac{1}{2}(4-4) = 0$ Hence, Be_2 doesn't exist</p> <p>(b) p- nitrophenol has a higher boiling point due to the presence of intermolecular hydrogen bond and that's why it is not steam volatile.</p> | 1 1 | 2 |

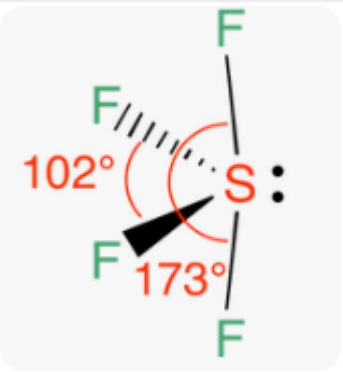

| | | | |
|-----|--|--|--|
| 20. | <p>overall reaction:</p> $\text{XeO}_6^{4-} + \text{F}^- \longrightarrow \text{XeO}_3 + \text{F}_2 \quad (\text{Acidic medium})$ $\text{XeO}_6^{4-} + 2\text{e}^- \longrightarrow \text{XeO}_3 \quad (\text{Reduction})$ $2\text{F}^- \longrightarrow \text{F}_2 + 2\text{e}^- \quad (\text{Oxidation})$ $\text{XeO}_6^{4-} + 2\text{F}^- \longrightarrow \text{XeO}_3 + \text{F}_2$ <p>Acidic medium:</p> $\text{XeO}_6^{4-} + 2\text{F}^- + 6\text{H}^+ \longrightarrow \text{XeO}_3 + \text{F}_2 + 3\text{H}_2\text{O}$ <p style="text-align: center;">OR</p> <p>Overall reaction :-</p> $\text{Cl}_2(\text{l}) \rightarrow \text{Cl}^-(\text{aq}) + \text{ClO}^-(\text{aq})$ <p>Half cell reaction at anode :-</p> $\text{Cl}_2(\text{l}) + 2\text{H}_2\text{O}(\text{l}) + 4\text{OH}^-(\text{aq}) \rightarrow 2\text{ClO}^-(\text{aq}) + 4\text{H}_2\text{O}(\text{l}) + 2\text{e}^-$ <p>Half cell reaction at cathode :-</p> $\text{Cl}_2(\text{l}) + 2\text{e}^- \rightarrow 2\text{Cl}^-(\text{aq})$ <p>Adding above two half cell reaction, we get :-</p> $\text{Cl}_2(\text{l}) + 2\text{OH}^-(\text{aq}) \rightarrow \text{ClO}^-(\text{aq}) + 4\text{H}_2\text{O}(\text{l}) + \text{Cl}^-(\text{aq})$ | <p>$\frac{1}{2}$</p> <p>$\frac{1}{2}$</p> <p>1</p> <p>$\frac{1}{2}$</p> <p>1</p> <p>2</p> | |

| 28. | <div style="text-align: center;"> $2\text{CH}_3\text{COONa} + 2\text{H}_2\text{O} \xrightarrow{\text{electrolysis}} \text{H}_3\text{C}-\text{CH}_3 + 2\text{NaOH} + \text{H}_2$ $\text{C}_6\text{H}_6 + (\text{CH}_3)_2\text{CHCl} \xrightarrow{\text{anhydrous AlCl}_3} \text{C}_6\text{H}_5\text{CH}(\text{CH}_3)_2$ $\text{C}_2\text{H}_2 \xrightarrow{\text{Red hot Fe tube/873 K}} \boxed{\text{C}_6\text{H}_6}$ </div> | 1 1 1 | 3 |
| 29. | <p>1. Based on VSEPR (valence shell electron pair repulsion theory), the four bond pairs of electrons on nitrogen will repel each other. As a result, they will be pushed apart giving the ammonium ion-molecule a tetrahedral shape. Therefore, it has tetrahedral electron geometry.</p> <p>2. The central atom in the Sulphur tetrafluoride molecule has 5 electron pairs. There are 4 bond pairs and one lone pair. It has a trigonal bipyramidal geometry (or structure). The lone pair is in the equatorial plane giving an overall see-saw shape.</p> <div style="text-align: center;">  </div> <p>3. The atomic number of phosphorus is 15. The electronic configuration of phosphorus is:</p> | 1 1 2 | 4 |

| | | | |
|-----|---|--------------------------|---|
| | <p>$P=1s^2 2s^2 2p^6 3s^2 3p^3$ The hybridization in PCl_5 is sp^3d. Therefore, the shape of PCl_5 is trigonal bipyramidal. The two axial bond pairs experience more repulsion than the three equatorial bond pairs. This makes the axial bond relatively weaker than the equatorial bond and they get easily broken.</p> <p style="text-align: center;">OR</p> <p>(i) This is mainly due to the presence of a lone pair which usually exerts greater repulsion on the bonding orbitals. Hence bond angle is less than $109^\circ 28''$. (ii) The bond angle in NH_3 is larger than in PH_3 because of the lower electronegativity of P which permits electron-density to be displaced towards hydrogen to a greater extent than in the case of NH_3.</p> | 2 | |
| 30. | <ol style="list-style-type: none"> 1. Trans-but-2-ene 2. Geometrical Isomerism 3. <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p>cis-But-2-ene</p> </div> <div style="text-align: center;">  <p>trans-But-2-ene</p> </div> </div> <p style="text-align: center;">OR</p> <p>The melting point of trans isomers is generally higher than that of cis isomers because in trans isomer, bulky groups lie on the opposite side of the double bond. Therefore, the molecule is symmetrical and hence packed well in the crystal lattice. Boiling point of cis isomers is higher than trans isomers because cis isomers is more polar and hence they have strong intermolecular forces between the molecules.</p> | 1 1 2 2 | 4 |

| | | | | |
|-----|-----|--|--|--------|
| 31. | (a) | <p>$l=2$ and $m=0$</p> <p>(b) $\text{no. of emission lines} = \frac{(n_2 - n_1)(n_2 - n_1 + 1)}{2} = \frac{(5-2)(5-2+1)}{2} = 6$</p> <p>(c) $\Delta x \cdot \Delta p \geq \frac{h}{4\pi}$</p> <p>(d) Hund's Rule of Maximum Multiplicity: Pairing of electrons in the orbitals belonging to the same subshell (p, d or f) does not take place until each orbital belonging to that subshell has got one electron each, that is, it is singly filled with parallel spin.</p> <p>(e) $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^1$</p> <p>(f)  $d_{x^2-y^2}$</p> <p>(g) (i) 4d (ii) 6s</p> | 1 1 1 1 1 1 $\frac{1}{2}$ $\frac{1}{2}$ | 1X5 =5 |
| 32. | (a) | <p>$aA + bB \rightleftharpoons cC + dD$</p> <p>• ideal gas law: $PV = nRT$ $P = \frac{n}{V} RT$</p> $K_c = \frac{[C]^c [D]^d}{[A]^a [B]^b}$ $K_p = \frac{(P_C)^c (P_D)^d}{(P_A)^a (P_B)^b} = \frac{\left(\frac{n}{V} RT\right)^c \left(\frac{n}{V} RT\right)^d}{\left(\frac{n}{V} RT\right)^a \left(\frac{n}{V} RT\right)^b}$ <p>Plugging this into the expression for K_p</p> <p>So, $K_P = K_C (RT)^{\Delta n}$</p> | $\frac{1}{2}$ $\frac{1}{2}$ 1 | 5 |

| | | | |
|------------|--|---|--|
| <p>(b)</p> | <p> $\text{H}_2\text{SO}_4(\text{aq}) \rightarrow 2\text{H}^+ + \text{SO}_4^{2-}$ 0.1M, 100 ml 10 millimoles 20 millimoles </p> <p> $\text{NaOH} \rightarrow \text{Na}^+ + \text{OH}^-$ 0.1M, 100 ml 10 millimoles 10 millimoles </p> <p>Number of millimoles of H^+ and OH^- neutralized in the mixture = 10 millimoles</p> <p>Number of millimoles of H^+ ion left unreacted in the mixture = 20 - 10 = 10 millimoles</p> <p> $[\text{H}^+]$ in the mixture = millimoles of H^+ ion / total volume of mixture $10 / 200 = 0.05 \text{ M}$ $\text{pH} = -\log[\text{H}^+]$ $\text{pH} = -\log(5 \times 10^{-2})$ $\text{pH} = 1.3010$ </p> | <p>1/2</p> <p>1/2</p> <p>1/2</p> <p>1/2</p> | |
| <p>(c)</p> | <p>Common ion effect - It is a phenomenon in which the degree of dissociation of any weak electrolyte is suppressed by addition of a small amount of strong electrolyte containing a common ion.</p> | <p>1</p> | |
| <p>(a)</p> | <p style="text-align: center;">OR</p> <p>Buffer solution - It is a water solvent-based solution which consists of a mixture containing a weak acid and the conjugate base of the weak acid or a weak base and the conjugate acid of the weak base. They resist a change in pH upon dilution or upon the addition of a small amount of acid/alkali to them.</p> | <p>1</p> | |
| <p>(b)</p> | <p> $\Delta G^0 = -2.303 R T \log K_c$ $\Delta G^0 = -2.303 \times 8.314 \times 300 \log(2 \times 10^{13})$ $\Delta G^0 = -7.64 \times 10^4 \text{ J mol}^{-1}$ </p> | <p>1</p> <p>1/2</p> <p>1/2</p> | |
| <p>(c)</p> | <p> $\text{HF} < \text{H}_2\text{O} < \text{NH}_3$ (Increasing order of pH) Reason:- Fluorine, oxygen and nitrogen belong to the same row of the periodic table. H-A bond priority becomes the deciding factor for determining the acidic strength. As the </p> | <p>1</p> | |

| | | | | |
|--|--|---|---|--|
| | | electronegativity of A increases, the strength of acid also increases and pH decreases. | 1 | |
